

Lattice® Breast Milk

Breast Milk

Collection and feeding

The MediCopia Milk application interfaced to the hospital information system ensures positive infant identification during feeding. Hospitals must follow the same precautions with breast milk or donated milk as with other bodily fluids, and the MediCopia Milk solution ensures that the right infant get the right feeding units. MediCopia Milk provides inventory and tracking features for milk containers brought to the hospital, either by the mother or from a milk bank. The system supports dividing units for neonatal feeding, adding supplements, and using formula as a substitute for breast milk.

MediCopia®

The MediCopia suite of applications provides a robust integrated mobile computing solution that allows hospitals to seamlessly integrate patient care and productivity tracking. These inherently smart applications streamline patient care, bringing error reduction, speed, and efficiency to care giving.

Lattice's MediCopia product is designed to achieve the following objectives:

- Elimination of preventable misidentification errors
- Process improvement
- Productivity improvement
